Revolutionizing Property Registration with Blockchain

Proxima
Vladimir Putkov | Amirsaid Velikhanov | Dmitriy Pak

Executive Summary and Vision

Our goal is to transform fragmented property records into a unified, digital ledger that enhances efficiency and reduces fraud.

Problem

- **Fragmented Systems:** 3,600+ county offices create delays and inflate costs.
- **Title Fraud & Errors:** Result in $145M+ annual losses.
- **Money Laundering:** Opaque ownership records enable illicit activity.

Value Proposition

- **Unified Blockchain Ledger:** Tamper-proof, transparent property registry.
- **Automated Title Transfers:** Smart contracts enable instant updates.
- **Enhanced Fraud Prevention:** Transparent records deter manipulation.

Market Overview

- **U.S. Real Estate Market:** Valued at tens of trillions.
- **Cost of Inefficiencies:** Billions lost annually.
- **Title Insurance:** ~$20B spent yearly to mitigate outdated processes.

Revenue Model

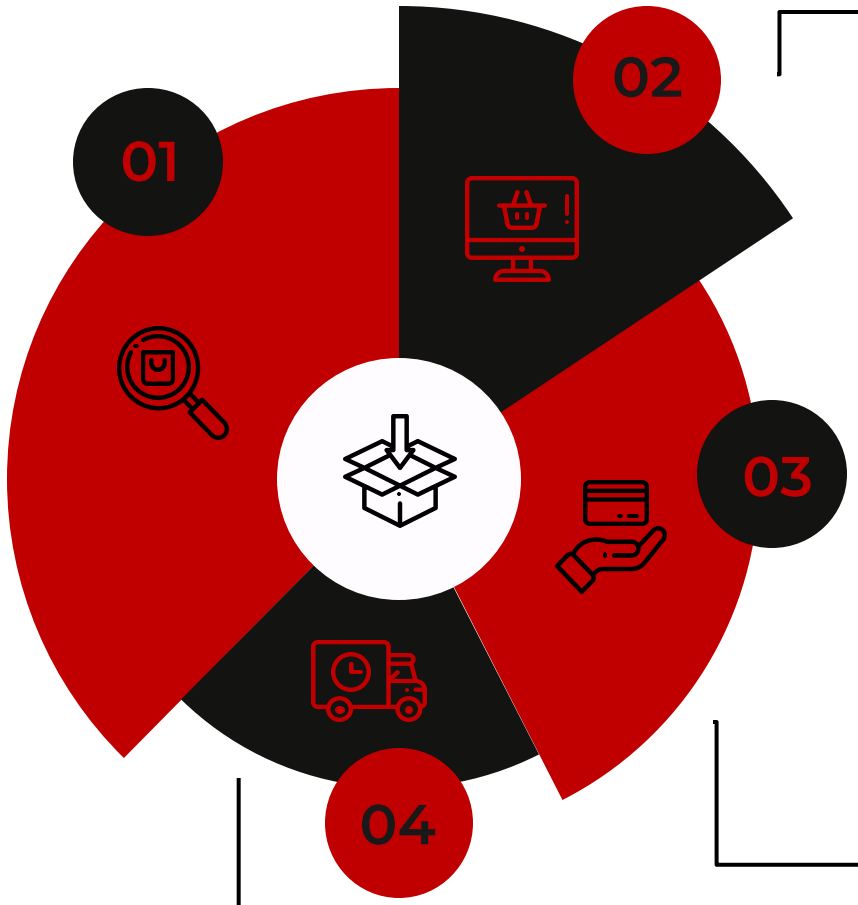
•**Transaction Fees:** ~$50 per transaction across millions of annual deals.
•**Subscription Fees:** From banks, realtors, and data platforms.
•**SaaS Model & Consulting:** Counties pay SaaS fees; consulting services offer additional revenue streams.

The Market Problem

The current property registration system is inefficient, error-prone, and susceptible to fraud, costing millions annually.

Fragmentation

Over 3,600 county systems result in delays and inconsistent records.



Fraud & Errors:

Traditional processes have led to millions in losses—title fraud costs have exceeded $145M.

Hidden Risks

An opaque system enables money laundering and tax evasion through shell companies.

Inefficiency

Home closings can take weeks or months with multiple intermediaries involve

Market Opportunity & Addressable Market

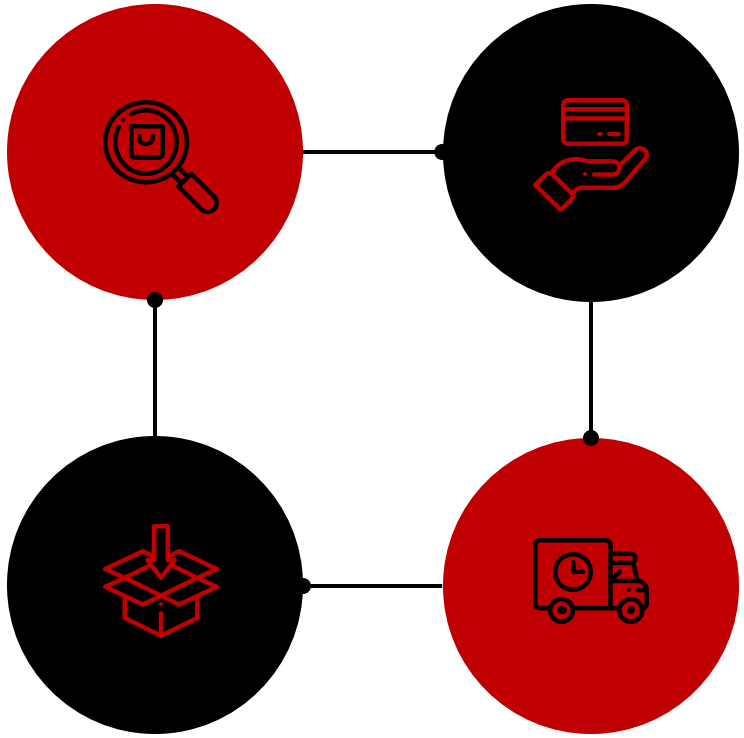
The vast U.S. real estate market presents enormous savings and growth opportunities by modernizing title records.

Enormous Value

The U.S. real estate market, valued at **$40+ trillion**, handles over **5 million transactions** annually, creating a significant opportunity for improved property registration systems.

Addressable Market

The solution targets county offices, title companies, banks, and real estate developers, representing a **multi-billion-dollar** opportunity to streamline property transactions across the U.S.



Cost Inefficiencies

Fragmented processes contribute to **$20B+ in title insurance costs** and billions more in delays each year.

Demand for Innovation

Increasing cases of **title fraud**, **ownership disputes**, and **money laundering** highlight the urgent need for secure and transparent record-keeping systems.

Proposed Blockchain Solution

Our solution is a permissioned blockchain that creates an immutable, automated registry integrated with existing systems.

We create a **single federal property registry** in which **every change of ownership or status is recorded on an immutable blockchain**, ensuring tamper-proof transparency and trust. By integrating **smart contracts**, our system automates mortgages, insurance, and related workflows, reducing costs and speeding up transactions for all stakeholders.

Single federal property registry

All property data is centralized in one national system for consistent, transparent record-keeping.

Records = blockhain

Every change in ownership or status is recorded on a tamper-proof ledger, ensuring security and trust.

Smart contracts

Automated workflows for mortgages, insurance, and related services reduce paperwork and speed up transactions.

Technology Architecture & Product Description

Our architecture features a layered, distributed network with smart contracts, ensuring robust security and seamless integration.

Our platform is like a one-stop shop for all your property data—no more digging through separate county records. It not only tracks ownership transfers but also logs changes such as: **Boundary Adjustments** (changes to property borders), **Area Modifications** (updates to lot size), **Subdivisions & Mergers** (splitting or combining plots), and **Encumbrance Updates** (adding or removing liens and easements).

01	02	03	04	05
Property purchase	Suffolk County Register office	API	Smart contract Verification	Blockchain record
Buyer and seller agree on the sale.	Officially reviews and approves documents	Connects local systems to the blockchain network.	Automatically checks and validates transaction conditions	Creates a secure, tamper-proof final entry

Value Proposition & Business Justification

Our blockchain solution secures titles, accelerates property closings, and significantly reduces costs for all stakeholders.

We create a **single federal property registry** that records every change in **ownership** or **status** within an **immutable blockchain**, thereby **reducing fraud**, **lowering transaction costs**, **speeding up property transfers**, and **increasing trust and transparency** for **governments**, **financial institutions**, **title professionals**, and **property owners**.

Governments & County Recorders	Financial Institutions (Banks, Lenders)	Property Owners & Buyers
Fragmented Systems	High Transaction Costs	Slow Processing
Fraud Prevention, Unified Records	Automation cuts the closing time from weeks to minutes, lowering financing costs	A transparent, real-time ledger builds confidence among buyers, sellers, and financial institutions

Revenue Model & Efficiency Savings

We generate revenue through transaction fees, subscription models, and premium data services, while realizing cost savings.

Transaction Fees

A modest fee (e.g., ~$50 per transaction) scales to generate significant revenue across millions of deals.

SaaS Model

Counties subscribe to our platform, converting capital expenditures into predictable operational costs.

Premium Data Services

Financial institutions and real estate platforms pay for real-time data and analytics.

Indirect Savings

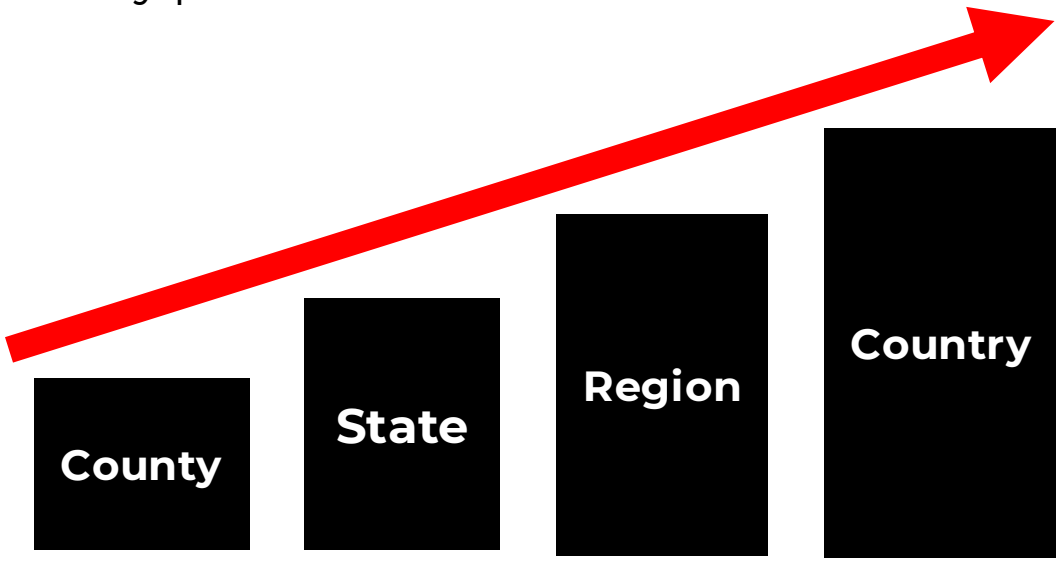
Reduced administrative overhead and lower title insurance premiums lead to billions saved annually.

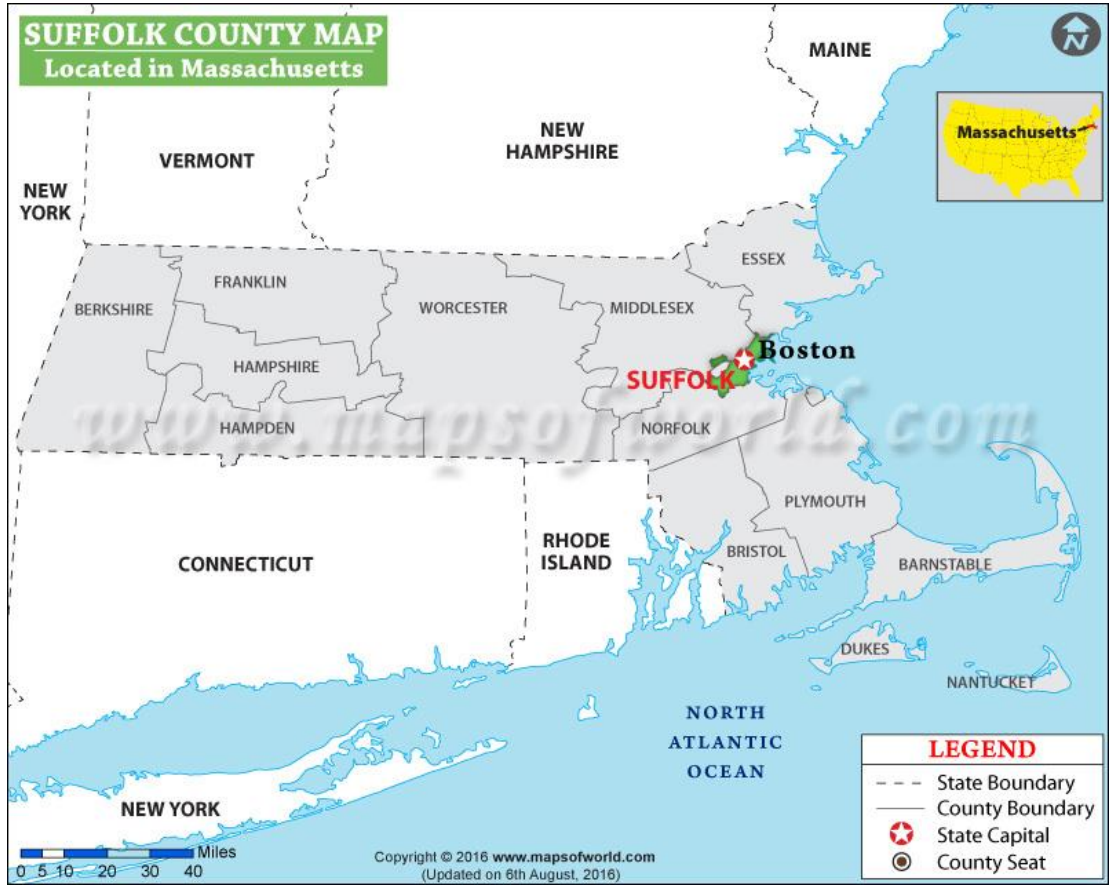
Adoption Strategy

Beginning with a pilot in Suffolk County before scaling nationwide, we ensure a smooth transition and scalability

Adoption Roadmap:

1. *Pilot Phase:* Launch in select jurisdictions (e.g., Suffolk County).
2. *Expansion:* Onboard additional counties and states over time.
3. *Nationwide Rollout:* Build a U.S.-wide network driven by proven benefits.





Risk Analysis & Mitigation

We proactively address legal, integration, and security risks through partnerships, dual-recording, and cybersecurity measures.

Regulatory & Legal Hurdles

Work with lawmakers to update laws and use dual-recording during transition.

Security & Key Management

Employ multi-signature safeguards, key recovery processes, and robust cybersecurity measures.

Integration & Data Migration

Gradually migrate and validate data with thorough testing and staff training.

Incumbent Resistance

Engage traditional players as partners by demonstrating cost reductions and new opportunities.

Scalability & Feasibility

Our scalable, federated blockchain network easily accommodates millions of transactions and is proven by multiple pilots.

High Throughput

Modern blockchain platforms handle millions of annual transactions with ease.

Federal Model

Each county maintains local control while contributing to a nationwide ledger.

Proven Pilots

Success stories in Georgia, Sweden, and U.S. trials (e.g., Cook County, VT) demonstrate feasibility.

Future Proof

Our modular design allows for expansion to additional registries and emerging technologies.

Conclusion & Q&A

Our solution transforms property registration into an efficient and transparent process, unlocking economic and societal benefits.

Summary: Secure, fast, and transparent property registration that modernizes an outdated system.

Impact: Lower costs, reduced fraud, and faster closings benefit every stakeholder—from governments to consumers.

Call to Action: Let's build the future of property registration together.
